Introduction

This Beta Test Plan outlines the structured approach for evaluating the first beta release of the Fundamental mobile application. The primary goal is to assess the stability, performance and usability of the app in real-world conditions.

Developed using React Native, Expo and Native Wind, Fundamental provides a decentralised finance experience tailored for ease of use, featuring wallet abstraction, token swapping, passive income earning and more.

Through this testing phase, we aim to ensure that the core functionalities operate reliably across different devices and environments, gather feedback from initial users and identify any issues that could impact user experience or technical performance.

Core Functionalities for Beta Version

Feature Name	Description	Priority	Changes Since TEK3
Wallet Creation	OAuth-based signup with providers like Google/Apple	High	Implemented
Profile Page	Modal view of wallet address, ENS, QR Code and copy actions	High	Implemented
Assets	Overview of user assets with live stats and charts	High	Implemented
Trade Page	Token-to-token swap functionality with real-time quoting and status tracking	High	Token swap implemented, trade history to come
Send Page	Send tokens to other wallet addresses.	High	Implemented
Earn Page	Deposit tokens into lending protocol to earn interests	Medium	De-prioritised
On-Ramping	Buy tokens using fiat (credit card, Apple Pay)	High	Prioritised
Off-Ramping	Convert tokens back into fiat	Medium	Same as above
Wallet Key Export	View/Export seed phrase or private key	Medium	No major change
Notification System	Push alerts for price changes and transaction status.	Medium	No major change

Token Framework Expansion	Easy addition of new tokens and types of tokens to the app	Ongoing	Strengthened with modular token support
Physical Payment Card	Integrate Monerium + Gnosis for physical card support.	Low (moons hot)	New exploratory feature

Beta Testing Scenarios

1. User Roles

Role Name	Description
User	All testers will use the app with full feature access

2. Test Scenarios

Scenario 1: Wallet Creation

<i>Role Involved</i>	User
<i>Objective</i>	Ensure streamlined OAuth login & Wallet creation using Privy
<i>Preconditions</i>	None
<i>Test Steps</i>	1. Open app and select login option (Mail, Apple, ...) 2. Authenticate with provider 3. App loads wallet with default state
<i>Expected Outcome</i>	Seamless wallet creation, redirection to home page

Scenario 2: Send Tokens

<i>Role Involved</i>	User
<i>Objective</i>	Ensure token sending works with confirmation
<i>Preconditions</i>	User logged in with available wallet balance
<i>Test Steps</i>	1. Go to the send page 2. Enter a recipient address or valid ENS 3. Select a token to send 4. Enter an amount of said token to send 5. Press "Send Funds" to open the confirmation modal 6. Confirm
<i>Expected Outcome</i>	Token is sent and new balance reflects instantly

Scenario 3: Profile Page

<i>Role Involved</i>	User
<i>Objective</i>	Ensure wallet identity displays properly and ENS registration works as intended
<i>Preconditions</i>	User logged in, without an existing ENS
<i>Test Steps</i>	1. On the Home page, tap on the user profile modal 2. Enter a valid ENS address to be created 3. Confirm to create the ENS 4. View displayed user data (wallet address, ENS, QR Code) 5. Tap the copy icon to copy the wallet address
<i>Expected Outcome</i>	User ENS is created and all identity data is displayed properly, copy works and the wallet address is in the clipboard

Scenario 4: Swap Tokens

<i>Role Involved</i>	User
<i>Objective</i>	Trade X quantity of token Y for token Z
<i>Preconditions</i>	User logged in, has assets deposited
<i>Test Steps</i>	1. Go to trade page 2. Select an input token X and quantity Y 3. Select an output token Z 4. Confirm trade
<i>Expected Outcome</i>	A trade order is created and executed. The user has Y less X, and an equivalent amount more of Z

Success Criteria

- Performance: All transactions processed in under 15 seconds (target).
- Reliability: 95% of all test scenarios complete without crash or bug.
- Compatibility: App runs smoothly across Android and iOS devices
- UX Feedback: At least 66% of beta testers report being satisfied with flow and ease of use.

Known Issues & Limitations

- Trade transactions may take a long time or occasionally fail due to slippage adjustments
- Fees are not collected yet

Conclusion

This Beta Test Plan sets the roadmap for validating the stability, performance, and usability of the Fundamental app. With clearly prioritized features, user-centric test scenarios, and planned responses to known issues, we are prepared to iterate based on real feedback and move closer to a secure, polished release.
