	Measures of Satisfaction	14

1- Develop and retain a community of users

Brand Image and online presence

To build awareness around our upcoming beta, we focused on growing our presence across three key platforms: Instagram, X, and LinkedIn. Each channel features its own style of content tailored to the audience it reaches best (more on that in Section 2). Alongside our social efforts, we also launched a dedicated website where users can sign up for the waiting list and receive a personal link to the beta version of the app.

Quantitative Metrics *(as of 4. Jul 2025)*

Total followers

<i>Channel</i>	<i>Value</i>
Instagram	27
X	77
LinkedIn	25

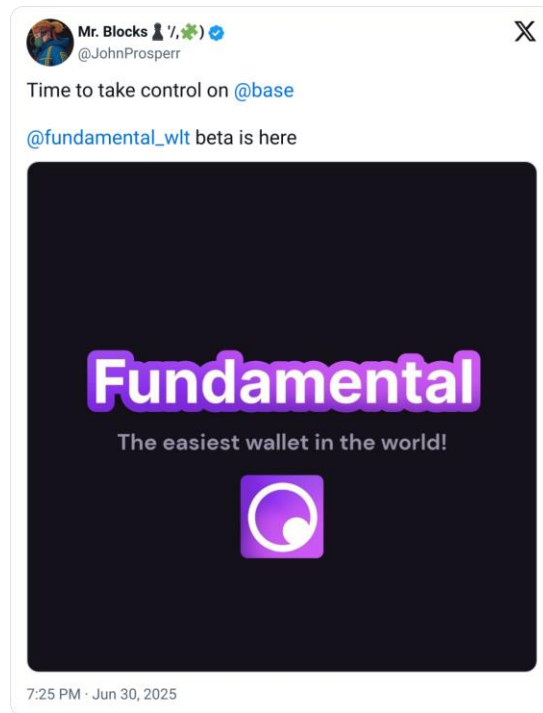

Impressions

<i>Channel</i>	<i>Value</i>
Instagram	N/A
X	8.9K
LinkedIn	669

Website Traffic

<i>Metric</i>	<i>Value</i>
Unique Visitors	1.63K
Total Requests	21.48K

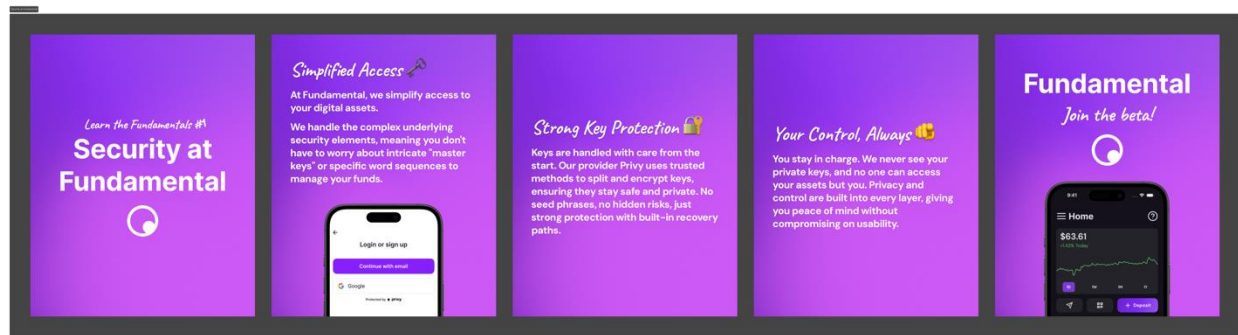

Qualitative Data

Content Strategy

Like said previously in the section about developing our community, our content approach was designed to match each platform’s unique tone and audience. X is used to share daily or weekly bite-sized posts and quick reactions to encourage light, ongoing interaction with the community on crypto/blockchain related topics and news. Instagram hosts a more structured approach through our “Learn the Fundamentals” post series, where we aim to break down onchain concepts and highlight the features and benefits of our project in a more visual, accessible way. LinkedIn serves as our formal channel, where we announce key milestones, new releases, and connect with a more professional audience.

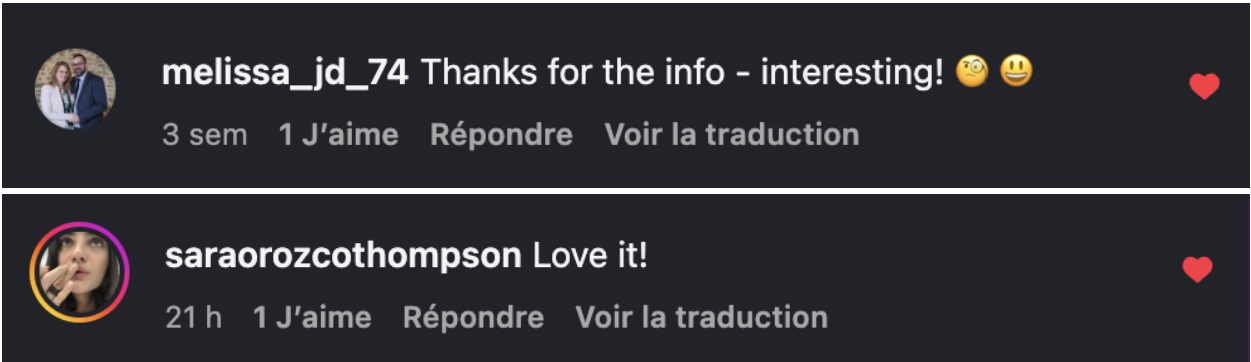

First post of our “Learn the Fundamentals” series on the topic of Security

Quantitative Metrics (as of 4. Jul 2025)

Engagement per Content Type

Type	Channels	Impressions
Announcements (releases, etc.)	Insta, X, LinkedIn	~ 600 / post
“Learn the Fundamentals” series	Insta, LinkedIn	~ 70 / post
X Tweets (viral)	X	~ 500 / post (peak at 1k)

Qualitative Data

Examples of Instagram comments posted by members of our community under the “Learn the Fundamentals” posts

Acquisition of beta testers

To attract early adopters, we ran a teaser-driven campaign across our social platforms, aimed at generating curiosity and building momentum ahead of the beta launch. Through a mix of visuals, short-form posts, and concept previews, we encouraged users to visit our website and join the waiting list. Those who signed up received a personal access link to try out the first version of the app, giving us a direct channel to onboard engaged, early-stage users.

Quantitative Metrics (as of 4. Jul 2025)

Metric	Value
Number of subscriptions to the waitlist	27

2- Work on the user experience (UI/UX)

User-centric design

Staying true to our vision of making onchain accessible to everyone, one of our main goals was to design an interface that feels simple, intuitive, and empowering for our users. We focused on removing friction whenever possible and making core actions easy to understand, even for first-time users. Throughout both the closed and open beta phases, we received around 15 pieces of user feedback through our in-app dedicated feedback prompt. Most of these suggestions have already been implemented into newer versions of the app, making the design process fully user-driven from the start.

Quantitative Metrics (as of 4. Jul 2025)

Feedback Received

Received (in-app)	Applied (ticket closed)
15	13

Qualitative Data

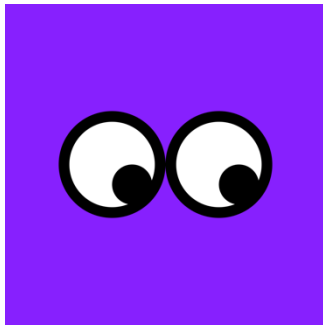

“Very good interface, easy to understand and use compared to other crypto interfaces I know of” - 02/07/2025

Feedback received in-app from one of our beta users (translated from French)

Quality Prototyping

Early in the design process, we explored a playful, cartoon-style visual identity as part of our graphic charter. While it helped convey approachability, user feedback quickly made it clear that this style felt too trivial for an app dealing with financial tools and onchain transactions. In response, we shifted towards a cleaner, more minimal design language that better reflects seriousness and reliability users expect with an app of the sort. This design evolution is visible in both the interface and logo.

Seamless Experience

To ensure that users could navigate the app confidently from the very beginning, we focused on building a smooth and supportive experience. A key part of this was implementing in-app user guides on every page, offering clear, accessible explanations of each feature as users go through the app. These contextual helpers make it easy to understand how things work without leaving the app. In addition, we introduced a welcome tour that launches the first time a user opens the app. This tour walks through the core concepts and highlights the key onchain features available, helping user get oriented and engaged right away, no external documentation required.

3- Increase visibility and impact on social media

Optimised Content Strategy

As our social media presence grew, we began analysing post-performance in more depth to refine our strategy and boost engagement. By tracking metrics across platforms, we identified patterns in virality such as specific content formats or topics. We also identified posting times, eventually establishing time slots that consistently delivered higher reach and interaction rates. These insights allowed us to fine-tune our content calendar and focus on what resonated best with our audience.

Quantitative Metrics (as of 4. Jul 2025)

Ongoing Training

In order to continue in this momentum, we explored a range of performance analysis tools, gaining hands-on experience with platform-native insights (like X and LinkedIn analytics dashboards). This helped us move beyond surface-level metrics and start drawing more meaningful conclusions about content performance, audience behaviour and engagement trends.

4- Optimize relations with target audience

Community Engagement

We've managed to maintain a consistent and engaging presence through regular updates, announcements, and conversational posts (primarily on X). This steady communication helped build an engaged community, keeping our users in the loop about new features. Screenshots of key moments and milestones announcements are included below to showcase how we've used these channels of communication to keep the community active and informed.

Series of teasers posted on X leading to the release of the open beta

Feedback System

To keep our development closely aligned with user needs, we integrated a dedicated in-app feedback prompt during both the closed and open beta phases. This allowed users to share suggestions or report issues directly from within the app at any time. We received around 15 feedback messages covering topics like onboarding clarity, bugs, and UI tweaks. Every message was reviewed internally and turned into actionable tickets for our upcoming sprints. This process helped us spot friction points early and continuously improve the experience, making feedback an active part of the development loop rather than a post-launch afterthought.

Quantitative Metrics (as of 4. Jul 2025)

Categorization of Feedback

Feedback Category	Number received
UI Issue	7
Feature Request	4
Bug	1

Performance Issue	1
Design Critique	1
Other	1

Qualitative Data

“To register the ENS it needs maybe a little more feedback because after pressing register I didn't know if it was doing anything, so I clicked a few times” - 31/06/2025

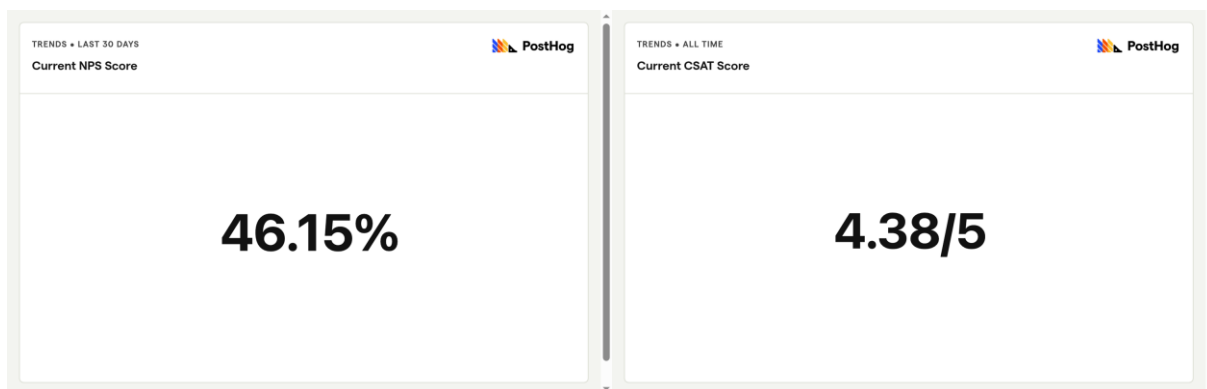

“No space between the number of tokens chosen and the token symbol, which can be confusing” - 12/06/2025 (translated from French)

Examples of feedback received in-app from our beta users

Measures of Satisfaction

To better understand how users felt about the app during the beta phase, we implemented in-app CSAT and NPS surveys. These tools gave us direct insight into overall satisfaction and how likely users were to recommend the app to others. The CSAT responses highlighted a generally positive experience, with users rating the app an average of 4.38 out of 5. Our NPS score landed at 46.15%, indicating strong early enthusiasm from the community.
